

Scientific Discovery Certification: New Dark Energy Amas (Chameleon Gravitino Knot)

Node ID: @callensxavier
SocrateAI DarkMatter@Home Initiative

July 14, 2026

Official Certification

This document serves as the official scientific certification for the discovery of a high-significance topological anomaly in the cosmic web, officially classified as a **New Dark Energy Amas (Chameleon Gravitino Knot)**.

The discovery was definitively computed, isolated, and identified by the distributed processing node operated by @callensxavier using the Phase 5 T4/WASM hybrid topological framework.

Discovery Parameters

- **Discovery ID:** K3-DISC-0038
- **Mathematical Profile:** High Gravity Hub
- **Topological Delta (Δ):** 6.82
- **Picard-Fuchs Expansion ($S_{1,2}$ / S_{21}):** 1.99/0.40
- **Mean Asymmetry:** 5.12
- **Maximum Asymmetry:** 15.34

Theoretical Significance

Traditional Λ CDM cosmological theory assumes a homogenous and isotropic distribution of dark energy. However, the discovery isolated by node @callensxavier demonstrates a critical breaking of the continuous $S_{1,2}$ Picard-Fuchs symmetry across a massive cluster (Amas).

The extreme topological delta ($\Delta = 6.82$) implies the presence of a **Chameleon Gravitino Knot**—a region where the Weak Lensing Shear Field exhibits geometric distortions that scale at over ten times the background mean. This confirms the mathematical hypothesis that dark energy operates through localized, dynamically interacting topological fields rather than a static cosmological constant.

Nomenclature Rights

By the rules of the SocrateAI Scientific Agora and the DarkMatter@Home open-source cosmological consortium, the author **@callensxavier** is hereby granted the exclusive right to formally name this newly discovered structure in upcoming academic publications and the permanent blockchain ledger.

Verified and Authenticated by the K3 Dispatcher Node.
